PRODUCT

Compost/Humus Blend

Value:

Conditions the soil and helps create good soil structure with improved aeration, drainage, water and nutrient holding capacity.

Recommended Uses:

Long lasting soil amendment for sandy soils.
Excellent soil amendment for conditioning heavy clay soils particularly at new home sites.

Top dressing for existing plants. Adding nutrients to the soil, while keeping moisture in.

Best Practices:

Use a soil test to determine what amount of organic compost is right for your situation. In existing flowerbeds where digging would disturb plant roots, put $\frac{1}{4}$ " to $\frac{1}{2}$ " of compost on top of the ground and scratch in before placing mulch on top of the compost and deep watering. In pre-plant preparation and reconditioning old beds, mix organic compost in the top 6" of the soil, water the beds two to three times, three days apart. This practice distributes soluble nutrients at the root level before seeding, using sod, or planting annuals.

Final seedbed preparations include direct seeding of lawns, vegetables and flowers. Be sure to water at least two times before planting your seeds. Top dress a new lawn with compost after the lawn shows significant new growth (at least once a month). After applying a top dressing of compost, apply 1" to 2" of water.

Specifications:

Feedstock: Made from clean ground yard trimmings (grass, leaves, limbs, and branches) from Curbside Yard Waste Collection Programs.

Particle Size: $\frac{1}{2}$ " minus

Organic Matter: 25% to 38%

Carbon to Nitrogen Ratio: 14:1 to 20:1

pH: 7.1 to 8.2

Calcium Ranges: * Calcium = 3.14% to 4.28%

Compost/Humus Blend

Compost/Humus blend contains three components:

Composted local green waste, Nitrogen stabilized sawdust & Redwood chips that are $\frac{1}{2}$ " or smaller.

We can apply the Compost/Humus blend to a thickness of 2-6 inches for you to mix or roto-till in with your soil.

It can also be applied as a top dress to add nutrients to your soil.
